

Glossary

Core Insurance Concepts

Insurance: A financial product that provides protection against specific risks (accidents, illness, property damage). Customers pay a premium, and the insurer promises to cover certain losses.

Underwriting: The process insurers use to evaluate the risk of insuring someone or something. Underwriters decide whether to accept or reject applications and how much to charge.

Carrier: Another name for an insurance company (e.g. Allstate, AIG).

Policy: The formal agreement (contract) between the insured (customer) and the insurance company. Outlines what's covered, how much coverage is provided, and under what conditions.

Premium: The amount a customer pays (monthly, quarterly, annually) for insurance coverage.

Submission: A request for insurance sent by a broker or agent to an insurer, including details about what's being insured (a building, vehicle, or person).

RiskOps / Federato Context

RiskOps: Short for "Risk Operations." At Federato, this refers to the tools and workflows that help underwriters make smarter, faster decisions using data and AI.

Appetite: What kinds of risks an insurer wants to take on. For example, a carrier might have appetite for commercial auto insurance in Texas, but not for homes in wildfire-prone areas.

In-Appetite: A submission that matches what the insurer is looking for. High-priority for underwriters.

Out-of-Appetite: A submission that doesn't align with the insurer's current interests or guidelines.

Data and Tech Terms

Dashboard: A web interface that shows key information at a glance, like a list of top submissions for the day, charts of premium amounts, or risk scores.

API (Application Programming Interface): A way for software systems to talk to each other. This project uses an API to get submission data.

SQL (Structured Query Language): A programming language used to access and manipulate databases, e.g. to filter submissions with premium > \$100,000.

JSON (JavaScript Object Notation): A lightweight format used to exchange data between systems. Data retrieved from the API will come as JSON.

Filtering: Selecting only the data you want from a larger dataset, e.g. only submissions from California.
